Copper Foil

Copper foil materials for semiconductors and electronics products etc.

Battery copper foil for electric vehicle batteries

Battery copper foil is an extremely thin copper foil whose thickness has been reduced to less than one-twentieth the thickness of human hair by electroplating after dissolving copper and is used in electric vehicle batteries

Battery copper foil serves as a negative electrode collector for electric vehicle batteries, is the path of current flow, and releases heat generated from the battery to the outside

Solus Advanced Materials provides high-strength/high-elongation battery copper foil to improve the energy density and mileage of electric vehicle batteries

The competitiveness of Solus advanced materials

- Development and mass production of the world's first battery copper foil
- The world's leading 'thin battery copper foil' manufacturing technology
- Competitive edge in delivery, with battery copper foil production bases in Europe and North America
- Supplying battery copper foil to many domestic-foreign battery manufacturers and EV

Production Process

① Dissolving high-purity copper materials

② Electrolytic Plating

③ Slitting & Sheeting

④ Inspection & Shipping

Battery Construction Process for Electric Vehicles

① Materials (battery copper foil)

② Battery copper foil + Graphite = Cathode

③ Battery Cell -> Module -> Pack

④ Battery Pack (Mounted on electric vehicles)

High-end battery copper foil mass production technology that enables improvements in the mileage of electric vehicles and high density and lightness of batteries

Standard battery copper foil
(BF-PLSP)
Cylindrical/Prismatic/Pouch type
6~8 μ m

High-elongation
battery copper foil
(SR-PLSP)
Prismatic/Pouch type
6~8 μ m

High-strength battery foil
(HTS-PLSP)
Pouch type
6~8 μ m

- Securing mass production technology for 6 μ m thin battery copper foil. Can wind more than 30 km.
- Enhancing yield by improving machining in battery manufacturing with high-strength battery copper foil before heat treatment
- Minimizing deformation during the charging/discharging of batteries by maintaining its high-strength properties even after heat treatment
- Improving battery productivity and life/stability with highly elongated battery copper foil

High-end copper foil materialized with advanced original technology

Copper foil is made micrometers thin (1/100 million meters) through electroplating by dissolving copper. As the uniformity of the surface is very important, advanced process control techniques are required.

Solus Advanced Materials has the only copper foil production base in Europe and is recognized for its competitiveness in the global market thanks to its long manufacturing experience and the know-how it has accumulated over 60 years

Copper foils made by Solus Advanced Materials are used in a wide range of fields, including semiconductors, telecommunication equipment, smartphones, smart cards, autonomous vehicles, and aircraft

Solus Advanced Materials' Unique Competitive Edge in Copper Foil

- Securing technological competitiveness with more than 60 years of manufacturing experience and know-how
- A wide range of products, from 1.5 μ m ultra-thin to 200 μ m copper foil
- Copper foil manufacturing for the semiconductors used in high-performance AI
- No. 1 market share in special copper foil materials for telecommunications

Production Process

Purpose of use

Providing customized solutions with various copper foils ranging from 1.5 μm to 200 μm

1.5 μm ultra-thin copper foil mass production technology

Uniform illuminance (roughness) manufacturing technology

Copper foil technology for communication with minimal signal loss

Special surface treatment technology for high strength/high elongation copper foil manufacturing

Copper foil suitable for microcirculation, high density, high integration, and high multi-layering of PCB

Quality competitiveness required to maintain a constant surface uniformity

Minimizing signal loss through less than 1.0 μm (based on Rz JIS) 'illuminance formation technology'

High strength and high elongation rate copper foil manufacturing technology and special surface treatment technology to prevent damage from the external environment

Leading the OLED Display Revolution through Material Technology Innovation

Organic Light Emitting Diode(OLED) is a self-luminous display composed of organic compounds that emits light on its own by electrical stimulation

It is thin and light, and has a very wide range of applications that include transparent displays, vehicle display IT, and many different devices due to its free form of implementation

Through continuous research and development, Solus Advanced Materials is leading the global display material market by developing its own OLED materials, Quantum Dot(QD) materials, and new functional materials

Solus Advanced Materials' Competitive Edge in Electronic Materials

- Various technologies and portfolios spanning all areas of light emitting · non-emitting
- Numerous 'organic material patents' with high efficiency·low voltage·longevity features
- Numerous 'future technology patents' such as new functional polymer materials, quantum dot(QD), etc.
- Development and supply of customized specific materials through joint development and collaboration

OLED Panel Application Device

The OLED materials made by Solus Advanced Materials are installed in TVs, smartphones including foldables, IT devices such as tablets and laptops, AR/VR wearable devices for the growing XR market and automotive display panels, and the scope of application is gradually expanding.

Business Field seen through OLED Layer Structure

Core Development Field: EML

- High efficiency, long-lived green phosphorescence P/N host
- Long lifetime deuterated fluorescence blue host
- High T1 blue phosphorescence host

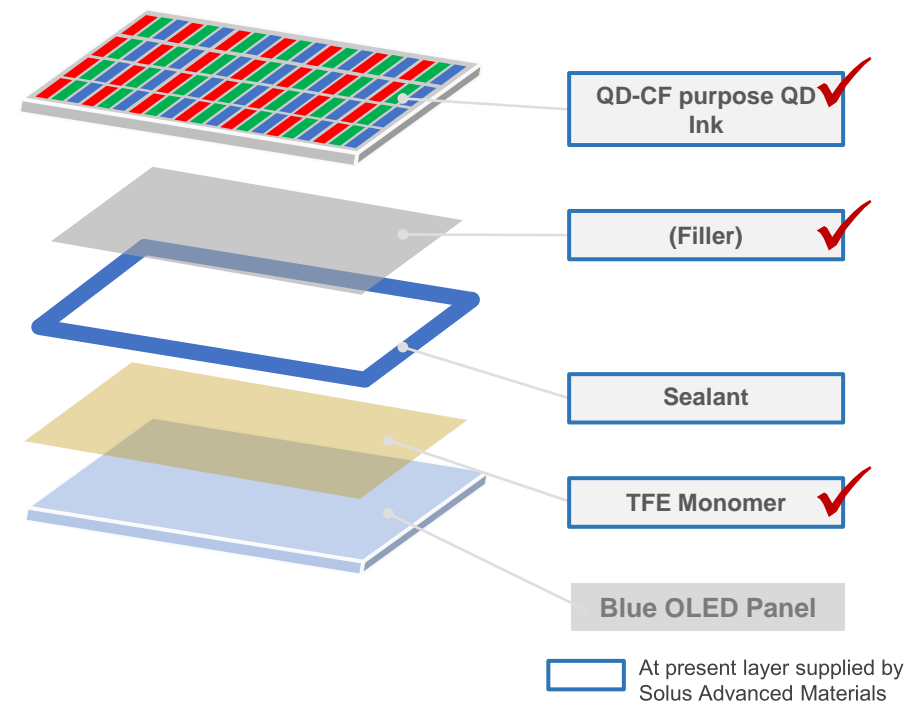

Core Business Field: aETL/HBL

- Core technical element to maximize OLED luminescence efficiency
- 30% increase in blue brightness and vivid color realization
- Increase lifespan of OLED panel

Business Portfolio Expansion

- Enter OLED organic material and encapsulation market for business portfolio expansion
- Develop Quantum Dot(QD) ink to secure future growth engine

Non-light emission material business Field seen through QD-OLED Layer Structure

Direction of key project: Filler

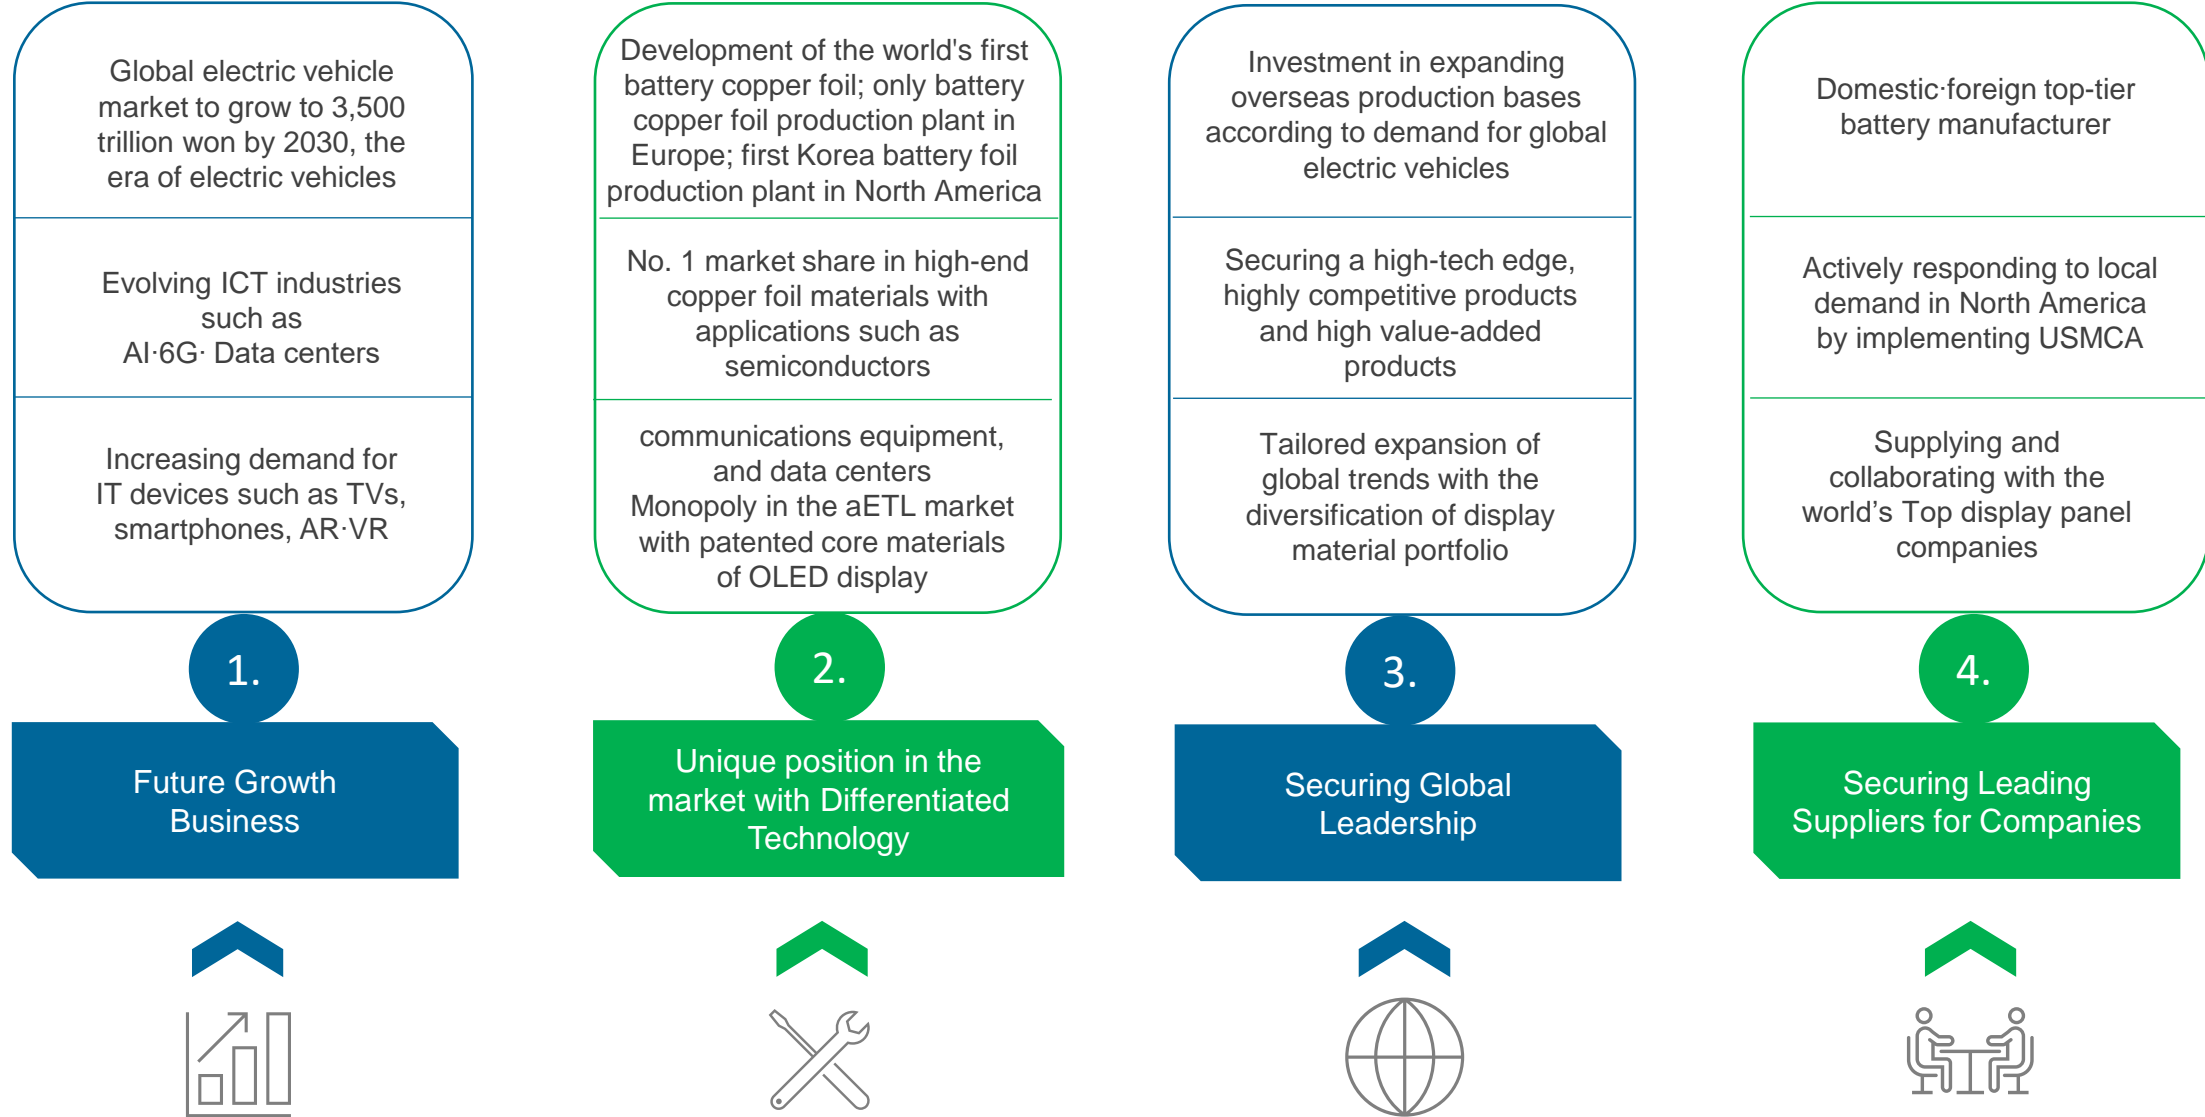

- Superb refraction rate for maximum light emission efficiency

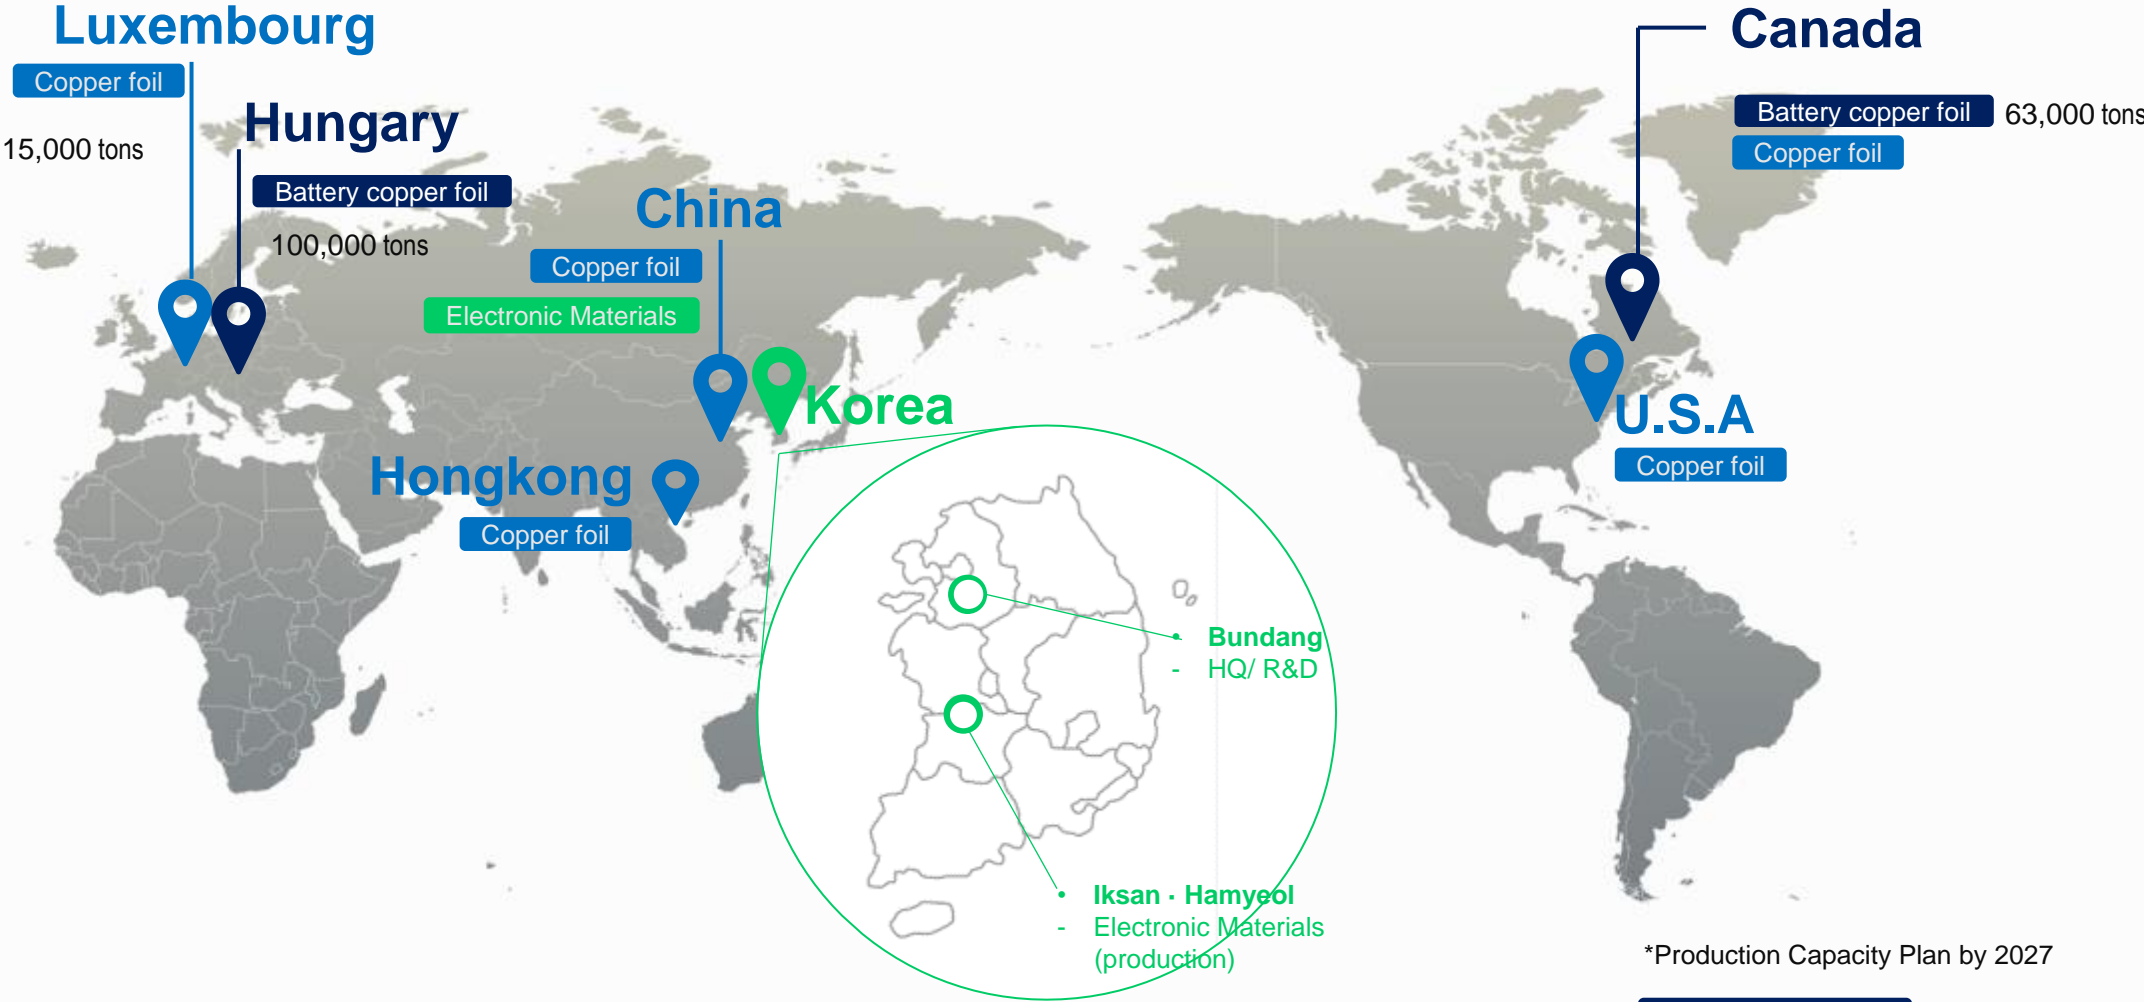

Direction of key development: : QD Ink

- Top level optical conversion efficiency and low viscosity ink manufacturing technologies
- High heat resistivity quantum dot thin layer manufacturing technology
- 30nm or less FWHM implementation and process stability improvement
- 25cps or less low viscosity QD ink manufacturing technology

Direction of key development: Low dielectric TFE

- Low dielectric characteristics assigned to improve the touch sensitivity.
- Provide highly functional materials responding to changes in panel structures

Solus Advanced Materials, Expanding To The World

R&D, production, and sales in 7 countries around the world
Solus Advanced Materials is where the customers are

- Holding global battery production bases in the U.S. and Europe, the battlegrounds for electric vehicles
- Resolving quality risks involved in long-distance transportation with same-day delivery, competitive edge in delivery
- Real-time support for major customers

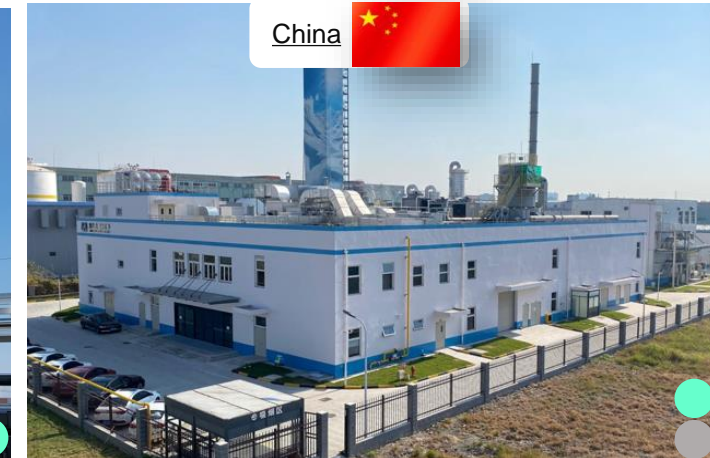

● R&D
 ● Production
 ● Sales

Europe

North America

Asia

Solus Advanced Materials pursues sustainable management for a better future

Sustainable Environment

- Realizing carbon neutrality
- Participating in the CFL-‘greenSPEED’

Safe and Healthy working environment

- Establishing EHS management system
- Minimizing pollutant emissions
- Promoting disaster preventive activities
- Regular safety education & training for executives and employees

Supply Chain Management

- Join international efforts to ban the use of conflict minerals
- Checking all matters of concern in accordance with international standards, and preparing and complying with conflict minerals management plans of the company, customers, and partners

Ethical Management

- Ethical management principles: Honesty and transparency; open mind and respect; and responsibility
- Awareness of responsibility to executives and employees, shareholders, investors, customers, and society

Transparent and Fair Management Practice

- Organizing the board of directors and audit committees

CSR

- ‘Attention to and help for the socially marginalized’
- Supporting drinking water facilities and hygiene kits for schools in Vietnam
- Providing MySkin Solus products to Chung-Ang University Hospital

*greenSPEED

An eco-friendly battery production process project supported by the European Union (EU) to reduce energy consumption and carbon footprint
